

- Refresh Tokens -

- What's Refresh Token? -

2 Tokens → generate → into Server || SignIn ليوه

Jwt Token Refresh token of any type [Jwt ---]

لديه Token معه

willToken || Client ليوه

is valid token ||

refreshToken ||

Expire token ||

Server checks if token expired then willToken will be invalid

Client sends refreshToken to Server to regenerate token

- Add Refresh Tokens Table -

RefreshToken class ↗ class Entity ①
[Owned] class

[Owned]

Public class RefreshToken

?

Public String Token {get; set;} = String.Empty;

Public Datetime ExpiresOn {get; set;}

Public DateTime CreatedOn {get; set;} = DateTime.UtcNow;

Public DateTime? RevokedOn {get; set;}

Public bool IsExpired => DateTime.UtcNow >= ExpiresOn;

Public bool IsActive => RevokedOn IS null && !IsExpired;

g

1 : M

← ApplicationUser ↗ now prop جزء من ②

Public List<RefreshToken> RefreshTokens {get; set;} = [];

[nav.prop. ↗ config. ↗ config. UXConfiguration] جزء من ③

builder.OwnsMany(x => x.RefreshTokens)

.ToTable("RefreshTokens")

.WithOwner()

.HasForeignKey("UserId");

Migration جزء من ②

UpdateDatabase ↗

- Generate Token

Leitzig Get Token

Validate JWT Tokens -

المفروض هيكون هناك API لـ Validate Token
أول واجهة هي الـ Endpoint لـ Validate Token
ثانية واجهة هي الـ RefreshToken

لما حاصل الـ UserId في الـ JWT Token
الـ Token هو معلومات عن الـ User
لما صحت الـ token الما ينزل أستوف الـ refreshToken

بعندها كل المعلومات حوله
UserId و RefreshToken

لـ RefreshToken الـ token واحد
نفس النوع نفس الدواعي

JWTToken ← generate
RefreshToken ←

IJwtProvider ← interface ①

validate
String? validateToken(String token);

JwtProvider = class implements ②

Public String? validateToken (String token)

Var tokenHandler = new JwtSecurityTokenHandler();
Var SymmetricSecurityKey = new SymmetricSecurityKey(Encoding.UTF8.GetBytes(options.key));

try

tokenHandler.ValidateToken(token, new TokenValidationParameters

ISSuerSigningKey = SymmetricSecurityKey,
validateIssuerSigningKey = true,
ValidateIssuer = false,
validateAudience = false,

ClockSkew = TimeSpan.Zero

g, out SecurityToken validateToken);

outPut

claims for jwt
jwt claims
claims for jwt
claims for jwt

var jwtToken = (JwtSecurityToken)validateToken;
return jwtToken.Claims.First(x => x.Type == JwtRegisteredClaimNames.sub).Value;

g

catch { return null; } g

- Generate Refresh Tokens -
Likely GetTokenAsync

الاول \rightarrow AuthResponse على العنوان و نطاق

String RefreshToken,
DateTime RefreshTokenExpiration

private readonly int refreshTokenExpiryDays = 14;

Generate Refresh Token is a Private Method (جواب ۳)

private static string GenerateRefreshToken()

```
    return Convert.ToString(RandomNumberGenerator.GetBytes(64));
```

٤١) حفظ ال جزء المادي GetTokenAsync (العنوان) Method في جزء الـ JWTToken.cs

```
var refreshToken = GenerateRefreshToken();
```

```
var refreshTokenExpiration = DateTime.UtcNow.AddDays(-refreshTokenExpiryDays);
```

```
// Refresh User || (User.RefreshTokens.Add(new RefreshToken
```

```
Token = refreshToken,  
ExpiresOn = refreshTokenExpiration  
});
```

فیصلہ الکلام دا فی لایا ہیز عنزیں ॥

```
await UserManager.UpdateAsync(user);
```

return Melville's literary legacy

```
return new AuthResponse(_____, refreshToken, refreshTokenExpiration);
```

- Add GetRefreshTokenMethod -

العنوان يعاد لـ RefreshToken وخطابه
لـ RefreshToken أو JWT Token أو RefreshToken
Auth Service هي من الممكن جعل

↓ IAuthService صرحة على ①

Task<AuthResponse> GetRefreshTokenAsync (String token, String refreshToken,
CancellationToken cancellationToken = default);

↓ AuthService صرحة على ②

Public Task<AuthResponse> GetRefreshTokenAsync (String token,
String refreshToken, CancellationToken cancellationToken = default)

var userId = _jwtProvider.ValidateToken(token);
if (userId is null)
 return null;

var user = await _userManager.FindByIdAsync(userId);
if (user is null)
